Leveraging Technology
to Advance Public Health

At its core, **Appriss Health** is a technology company.

We consolidate patient data and deliver relevant analytics, so that providers can better treat **behavioral health** issues and **substance use** disorders.

This requires a significant investment in technology which results in a number of benefits.

▷ Cloud-Based for Your Convenience

With our secure, cloud-based platforms hosted on Amazon Web Services, you have 24/7/365 access and never need to worry about the expenses related to servers and other hardware. This arrangement also ensures the highest levels of scalability. No matter the volume of your data queries, we can scale dynamically and quickly, resulting in no change in performance for your clinicians and other end users.

▷ Integration and Interoperability for Ease of Use

Having built industry standards best practices for workflow integration and interoperability, you will experience an efficient, easy-to-use interface. Specifically, our Prescription Drug Monitoring Program infrastructure, including interstate data sharing, in-workflow data integrations, and advanced analytics, work together to provide the most useful clinical decision support system in behavioral health and substance use.

▷ Continual Process Improvements for Your Satisfaction

Considering how quickly healthcare moves forward—particularly around patient data and state compliance—we know it is critical to remain flexible. That is why we built our development process to allow for upgrades every two weeks. While we often recognize the need to upgrade, we regularly collect feedback from our customers across nearly all 50 states, hundreds of health systems, and thousands of facilities.
