

Promoting Standards for Quality Patient Information

Data standards are formal agreements on the general management of data, including the definition, structuring, sharing, and use. In healthcare, the purpose of standards is to govern efficient and effective data sharing, resulting in improved quality of patient information.

▶ Taking Standards Seriously

Since our inception, we have continuously created technology solutions with standards top of mind—both intimately understanding them and ensuring we comply with them. Currently, our focus is on the FHIR interoperability standards, along with ASAP, NCPDP, and several others. With this focus, we can support our customers in their quest to improve patient information and public health.

▶ Offering Flexibility

While our PMP Gateway solution, which integrates prescription drug monitoring program data with electronic health records or pharmacy management systems, was created with our unique standards, connection and delivery of data is not limited by our company. Our customers determine their public health strategy, and we support their vision, which means using whichever standards are necessary to connect to requested sources or consumers of data.

▶ Focusing on the Future

It is our mission to connect data and share analytics with providers for the betterment of public health, and we believe that the PDMP can serve a broader role in this mission. With that comes a dedication to standards, such as FHIR, which requires an ongoing investment in resources. We will remain at the forefront of the industry by employing the technical talent necessary to work with the standards that the industry and our customers demand.

Answering All of Your Data Integration Needs

Regardless of your needs and the standards that govern them, **Appriss Health** is your answer. You will receive not only a data integration solution, but also a true partner who helps you securely share data across states, ensure compliance, and enable providers to make more informed treatment decisions. And you will have access to call center support and a dedicated customer relationship manager along the way.
