

Delivering Data & Analytics Where It Is Needed Most

With pre-built API connectivity to 500+ EHRs and pharmacy management systems and industry standards of best practices for workflow integration, we can provide clinicians with data from their state's Prescription Drug Monitoring Program (PDMP) directly in their clinical workflow.

VISUALS TELL A STORY

While our technology solutions may be complex behind the scenes, they are simple to use. This simplicity starts with the visual presentation of the data. **Patient prescription history and other relevant information is consolidated into a user-friendly, customizable view** that is designed based on feedback from hundreds of clinicians and other end users.

ANALYSIS OFFERS SUPPORT

We also offer data analytics that can be used at the point of care, helping clinicians understand controlled substance prescribing risks for each patient by objectively scoring PDMP data. **The data is real-time and can be pulled from multiple platforms and states**, ensuring clinicians have a complete history for every patient and can intervene when troubling patterns exist.

FUNCTIONALITY SAVES TIME

On average, at the point of care, it was taking clinicians up to four minutes and up to 50 clicks to leave the EHR to check a patient's history in the PDMP and comply with state law. **With our EHR-PDMP integration, it takes well under one minute and just a few clicks**—saving valuable time and increasing physician satisfaction.
